Edwards Cardioband Mitral System
Take Home Messages

In Mitral Regurgitation

• Use of the Edwards Cardioband System for mitral annular repair is feasible and safe

• One-year interim results of European CE mark trial show:
  - Significant and consistent MR reduction with MR ≤2+ in 94% of patients
  - Significant and durable reduction in septolateral diameter
  - Significant clinical improvement with 79% of patients in NYHA functional class I/II

• Teachable, learnable, and reproducible procedure

• Preserves the native anatomy keeping options open for potential future interventions
Edwards Cardioband Tricuspid System
Take Home Messages

In Tricuspid Regurgitation

• Use of Edwards Cardioband System for tricuspid regurgitation is feasible and safe

• Procedure is standardized with short learning curve for mitral users

• Significant annular reduction is achievable in the tricuspid position

• Continuing recruitment in European CE mark study which shows promising early clinical results

• Definition of most relevant clinical endpoints for TR patients is needed among Heart Teams including heart failure physicians together with industry support
Thank you for your attention!
